

TRICK FOR RESHAPING YOUR TIRE

For a tubeless tire that has been compressed for shipping and is odd shaped, the following can help restore the shape so that an initial seal is obtained when inflating on a tubeless rim:

- 1) The tire is received from shipping with a compressed shape

- 2) Heat in the sun to warm the tire. If it is cold outside but sunny, place the tire in a black plastic garbage bag.

- 3) When suitably warm, manipulate the tire to open the tire so the side walls are separated
- 4) Insert a garbage bag in to the interior of the tire. Slowly inflate using care not to over inflate bursting the bag. If needed, a disc can be installed to block the bead seat opening. Inflate until the bead seat width slightly exceed the required width and tire shape is restored. Allow to sit.
